Solving system of linear equations

$$2x + y = 5$$

$$x - y = -2$$

By substitution, the second equation implies $x = -2 + y$, substitute to the first gives

$$2(-2 + y) + y = 5 \implies 3y = 9 \implies y = 3 \implies x = 1$$

By elimination, adding two equations gives

$$3x = 3 \implies x = 1$$

$$1 - y = -2 \implies y = 3$$

Solving system of linear equations

More complicated system

$$-x + 4y + z = -5$$

$$2x + 2y + z = 3$$

$$x - 2y - 2 = 3$$

Convert to matrix form

$$\begin{bmatrix} -1 & 4 & 1 \\ 2 & 2 & 1 \\ 1 & -2 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -5 \\ 3 \\ 3 \end{bmatrix}$$

Augmented matrix

$$\begin{bmatrix} -1 & 4 & 1 & -5 \\ 2 & 2 & 1 & 3 \\ 1 & -2 & -1 & 3 \end{bmatrix}$$

Solving system of linear equations

$$\begin{bmatrix} -1 & 4 & 1 & -5 \\ 2 & 2 & 1 & 3 \\ 1 & -2 & -1 & 3 \end{bmatrix}$$

Elementary row operations for Gauss–Jordan elimination

- Multiply a row by a nonzero constant
- Interchange two rows
- Add a constant times one row to another

$$\begin{aligned} \xrightarrow{-1R_1} & \begin{bmatrix} 1 & -4 & -1 & 5 \\ 2 & 2 & 1 & 3 \\ 1 & -2 & -1 & 3 \end{bmatrix} \xrightarrow{\begin{matrix} R_3 - R_1 \\ R_2 - 2R_1 \end{matrix}} \begin{bmatrix} 1 & -4 & -1 & 5 \\ 0 & 10 & 3 & -7 \\ 0 & 2 & 0 & -2 \end{bmatrix} \xrightarrow{R_2/10} \begin{bmatrix} 1 & -4 & -1 & 5 \\ 0 & 1 & \frac{3}{10} & -\frac{7}{10} \\ 0 & 2 & 0 & -2 \end{bmatrix} \\ & \xrightarrow{R_3 - 2R_2} \begin{bmatrix} 1 & -4 & -1 & 5 \\ 0 & 1 & \frac{3}{10} & -\frac{7}{10} \\ 0 & 0 & -\frac{3}{5} & -\frac{3}{5} \end{bmatrix} \xrightarrow{-\frac{3}{5}R_3} \begin{bmatrix} 1 & -4 & -1 & 5 \\ 0 & 1 & \frac{3}{10} & -\frac{7}{10} \\ 0 & 0 & 1 & 1 \end{bmatrix} \end{aligned}$$

We have reached row echelon form

Solving system of linear equations

Backward:

$$\begin{bmatrix} 1 & -4 & -1 & 5 \\ 0 & 1 & \frac{3}{10} & -\frac{7}{10} \\ 0 & 0 & 1 & 1 \end{bmatrix} \xrightarrow[\begin{smallmatrix} R_2 - \frac{3}{10}R_3 \\ R_1 + R_3 \end{smallmatrix}]{\hspace{1cm}} \begin{bmatrix} 1 & -4 & 0 & 6 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & 1 \end{bmatrix} \xrightarrow{R_1 + 4R_2} \begin{bmatrix} 1 & 0 & 0 & 2 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & 1 \end{bmatrix}$$

Solving system of linear equations

$$-x + 4y + z = -5$$

$$2x + 2y + z = 3$$

$$x - 2y - 2 = 3$$

$$\begin{bmatrix} 1 & 0 & 0 & 2 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & 1 \end{bmatrix}$$

The solution is given by

$$x = 2, \quad y = -1, \quad z = 1$$

Gauss–Jordan elimination

$$\begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & 2 & 3 \\ 1 & 0 & -1 & 0 \\ 2 & 2 & 1 & 5 \end{bmatrix}$$

The leftmost nonzero column is the first column, it already has leading 1

$$\begin{array}{c} \xrightarrow{R_3-1R_1} \\ \xrightarrow{R_4-2R_1} \end{array} \begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & 2 & 3 \\ 0 & -2 & -2 & -4 \\ 0 & -2 & -1 & -3 \end{bmatrix} \begin{array}{c} \xrightarrow{R_4+2R_2} \\ \xrightarrow{R_3+2R_2} \end{array} \begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 2 & 2 \\ 0 & 0 & 3 & 3 \end{bmatrix}$$

$$\begin{array}{c} \xrightarrow{1/2R_3} \\ \xrightarrow{R_4-3R_3} \end{array} \begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 3 & 3 \end{bmatrix} \begin{array}{c} \xrightarrow{R_4-3R_3} \\ \xrightarrow{R_4-3R_3} \end{array} \begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

We have reached row echelon form with Gaussian elimination

Gauss–Jordan elimination

Backward

$$\begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_1 - 2R_2} \begin{bmatrix} 1 & 0 & -3 & -2 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\begin{array}{l} \xrightarrow{R_2 - 2R_3} \\ \xrightarrow{R_1 + 3R_3} \end{array} \begin{bmatrix} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Gauss–Jordan elimination

$$\begin{aligned} \begin{bmatrix} 1 & 2 & -1 & \alpha \\ 2 & 3 & -2 & \beta \\ -1 & -1 & 1 & \gamma \end{bmatrix} &\xrightarrow[R_2-2R_1]{R_3+R_1} \begin{bmatrix} 1 & 2 & -1 & \alpha \\ 0 & -1 & 0 & \beta-2\alpha \\ 0 & 1 & 0 & \gamma+\alpha \end{bmatrix} \xrightarrow{-R_2} \begin{bmatrix} 1 & 2 & -1 & \alpha \\ 0 & 1 & 0 & 2\alpha-\beta \\ 0 & 1 & 0 & \gamma+\alpha \end{bmatrix} \\ &\xrightarrow[R_1-2R_2]{R_3-R_2} \begin{bmatrix} 1 & 0 & -1 & -3\alpha+2\beta \\ 0 & 1 & 0 & 2\alpha-\beta \\ 0 & 0 & 0 & \gamma-\alpha+\beta \end{bmatrix} \end{aligned}$$

The corresponding linear system is consistent, only if $\gamma - \alpha + \beta = 0$. In this case

$$x - z = -3\alpha + 2\beta, \quad y = 2\alpha - \beta$$
